Instantly Search Terabytes of Text

Executive Summary

- dtSearch enterprise and developer product line instantly searches terabytes of text
- dtSearch's own document filters support a wide variety of data formats, including "Office" files, PDFs, emails and attachments, online data and other databases
- dtSearch products have over 25 search features, and can display retrieved data with highlighted hits
- Developer products include faceted searching and other advanced data classification options
- SDKs span multiple platforms with APIs for .NET, C++ and Java

Key Benefits

Terabyte Indexer. dtSearch enterprise and developer products can index over a terabyte of text in a single index, spanning multiple directories, emails and attachments, online data and other databases. dtSearch products can create and search any number of indexes, and can search indexes during updates.

Concurrent, Multithreaded Searching. dtSearch developer products support efficient multithreaded searching, with no limit on the number of concurrent search threads.

Over 25 Search Options. dtSearch products have more than 25 search features, including special forensics search options and extensive international language support. For federated searching, products have integrated relevancy ranking with highlighted hits across both online and offline data.

Faceted Search and Data Classification. Developer APIs support faceted search along with multiple other full-text and metadata classification options. See dtsearch.com/articles for technical articles with sample code on SQL, faceted searching and other topics.

Document Filters and Supported Data Types. dtSearch's own document filters support "Office" documents, PDFs, compression formats, emails and multilayer nested attachments, online data and other databases. After a search, dtSearch products can display retrieved data with highlighted hits. (Document filters are built into the product line and also available for separate licensing.)

SDKs. The dtSearch Engine offers .NET, Java and C++ APIs. Platforms include Windows and Linux (with separate native 64-bit builds of both) as well as Mac OS X, Android and UWP in beta. Azure users, see dtsearch.com/azure for a developer tutorial on searching via Microsoft's RemoteApp, giving search the "look and feel" of a native application running under Windows, Android, iOS or OS X.
